Restore Variables

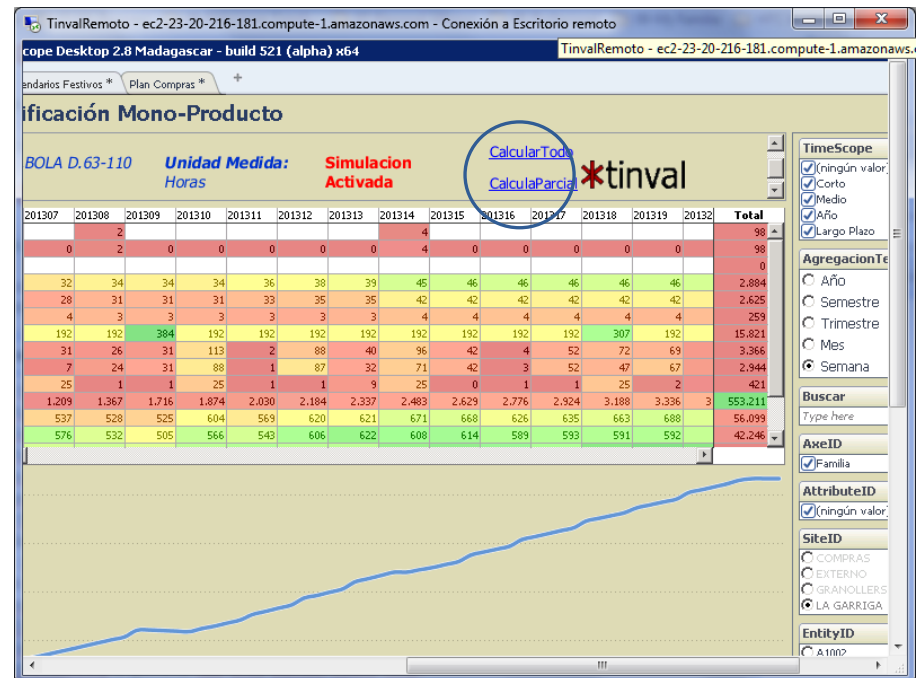

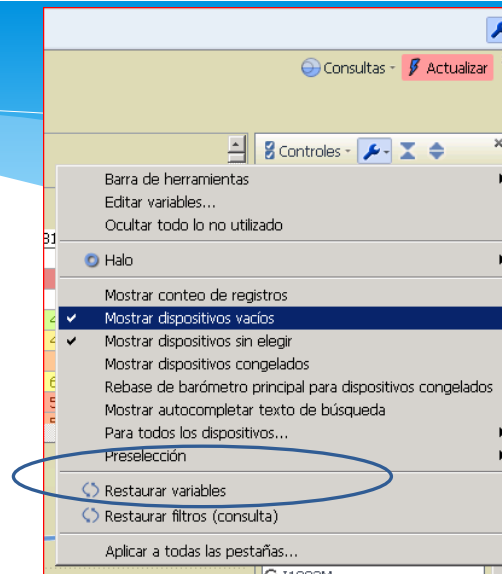

- Restore Variables:

It's located in the side filters panel, when the user manage the model he can use variables to simulate (what if) some values, but at the end he ask for a button to reset the variables and return to initial the state.

In viewer mode the side panel tools are not accessible for the user, and it a long way for managing it.

Side_panel/panel_tools/restore_variable.

What we want is to activate it as a button in the content view.

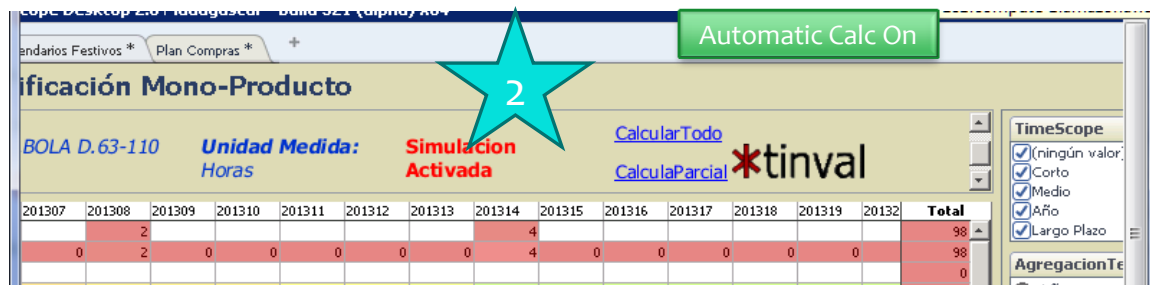

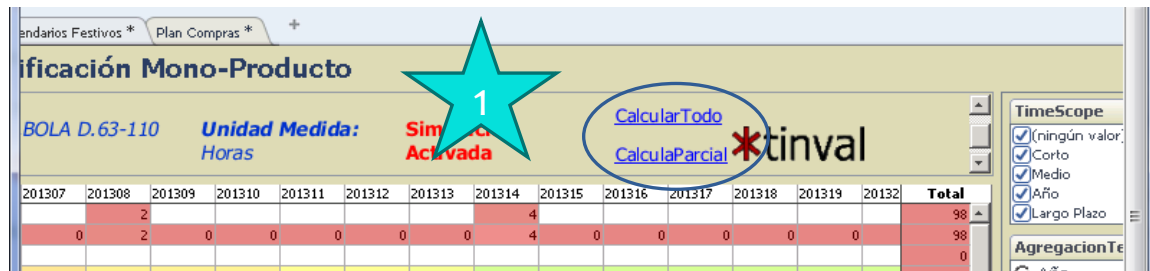

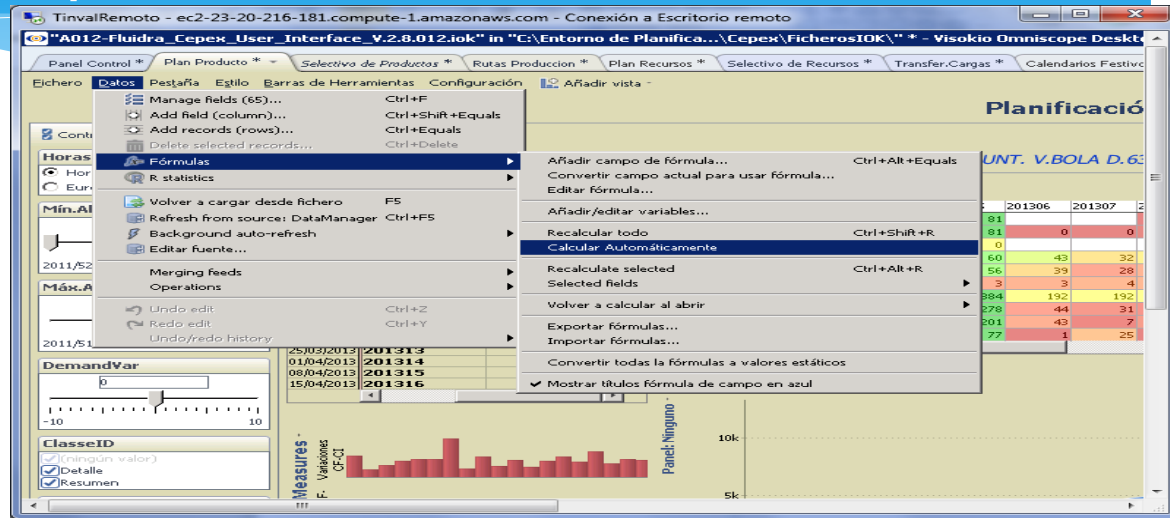

Automatic Calculi On/Off

- In heavy models (a lot of formulas) the user often need to work in non automatic calculi mode, this function is located in a submenu data/formula/automatic Calcul.

It's a long way for the user if he have to manage it several times on a session.

1) For our Workflow it's better if he has a link in each tab to manage it.

2) Alternatively a general tab area Button could help.

Publish all

Our workflow interact with the user allowing him to update data in a table's View, Publish all act as 'Save Data to database' button.

1) Actually at the end of the session he have to go to 'data manager' (Panel de Control' tab and then publish data (save) to the database.

2) I thing it's easiest if he can find a link (button) in each tab for do it when he finish a tab data introduction.
